

# SPA SECURE Tabex® TECHNICAL DATA SHEET

## What is Spa Secure?

- ◆ a triple purpose liquids sequestering agent designed to remove and separate metals such as iron, copper and manganese out of spa water before they are able to leave deposits in the form of stains, on the spa surfaces, as well as protect the spa equipment from corrosion
- ◆ ties up dissolved calcium and microcontaminants into masses large enough to be trapped by the filter which prevents calcium scale from forming on spa equipment and other surfaces as well as the formation of cloudy water

## How does Spa Secure work?

- ◆ stains, tarnish and discoloration to the spa surface or piping are all forms of precipitation and oxidation of undissolved mineral deposits
- ◆ suspending mineral deposits in the water prevents them from latching onto spa surfaces and causing stains as well as cloudy water
- ◆ in the case of calcium it prevents pitting and scaling of spa surfaces and removes undissolved solids to the filter

## Dosage Rates

- ◆ add 60 mL of Spa Secure for every 1,000 L of spa water directly into the spa while the spa is being filled

## When can I use the spa?

- ◆ the spa is safe 15 minutes after treatment

## When do I use Spa Secure?

- ◆ should be added during initial fill, or refill of the spa
- ◆ maintenance dose of 30 mL per every 1,000 L should be added weekly
